ABSTRACT

A system and method is provided for quoting reinsurance. A web server receives electronic requests for reinsurance quotations and authenticates users generating the requests. An application server connects with the web server to formulate the quotation based upon the requests. A database connects with the application server and stores the quotation and other data (e.g., actuarial tables) used to generate the quotation. The electronic requests may include a selection of a preexisting quote within the database. A profitability analysis engine may analyze profits of the quotation, so that the customer users further receive profitability information associated with the quotation.
